# WHAT ABOUT THESE...

Did you know they are built with a Microprocessor or Microcontroller too?

**STEAM CLOWN™**  
**& Squeaky Hinge**  
**PRODUCTIONS**

# WHAT IS A MICROPROCESSOR? WHAT'S THE DIFFERENCE BETWEEN A MICROPROCESSOR AND A MICROCONTROLLER?

- A microprocessor, like the Intel Or AMD processors, contains
  - a CPU, but needs help from other components to make it function, components like DRAM and hard drives
- A microcontroller, like the Arduino, is a standalone single-chip that contains
  - a CPU, read-only memory to store the program, RAM to store variables used in the execution of the program.

# DID YOU SAY "ARDUINO"?

- Arduino Is An Open-source Electronics Platform
  - With easy to use hardware & software.
  - Intended for anyone making interactive projects
- Arduino Can Sense & Control It's Environment
  - Receiving information from sensors on input pins
  - Affecting it's surroundings by controlling lights, motors, actuators, etc on output pins
- You Tell Your Arduino What To Do
  - Writing code in the Arduino programming language
  - Using the Arduino development environment

# THERE ARE MANY TYPES OF ARDUINOS

# BLINK - FIRST SKETCH → C++

Defines Variables  
Like I/O Pin  
Connected to LED

Setup Loop

Main Loop

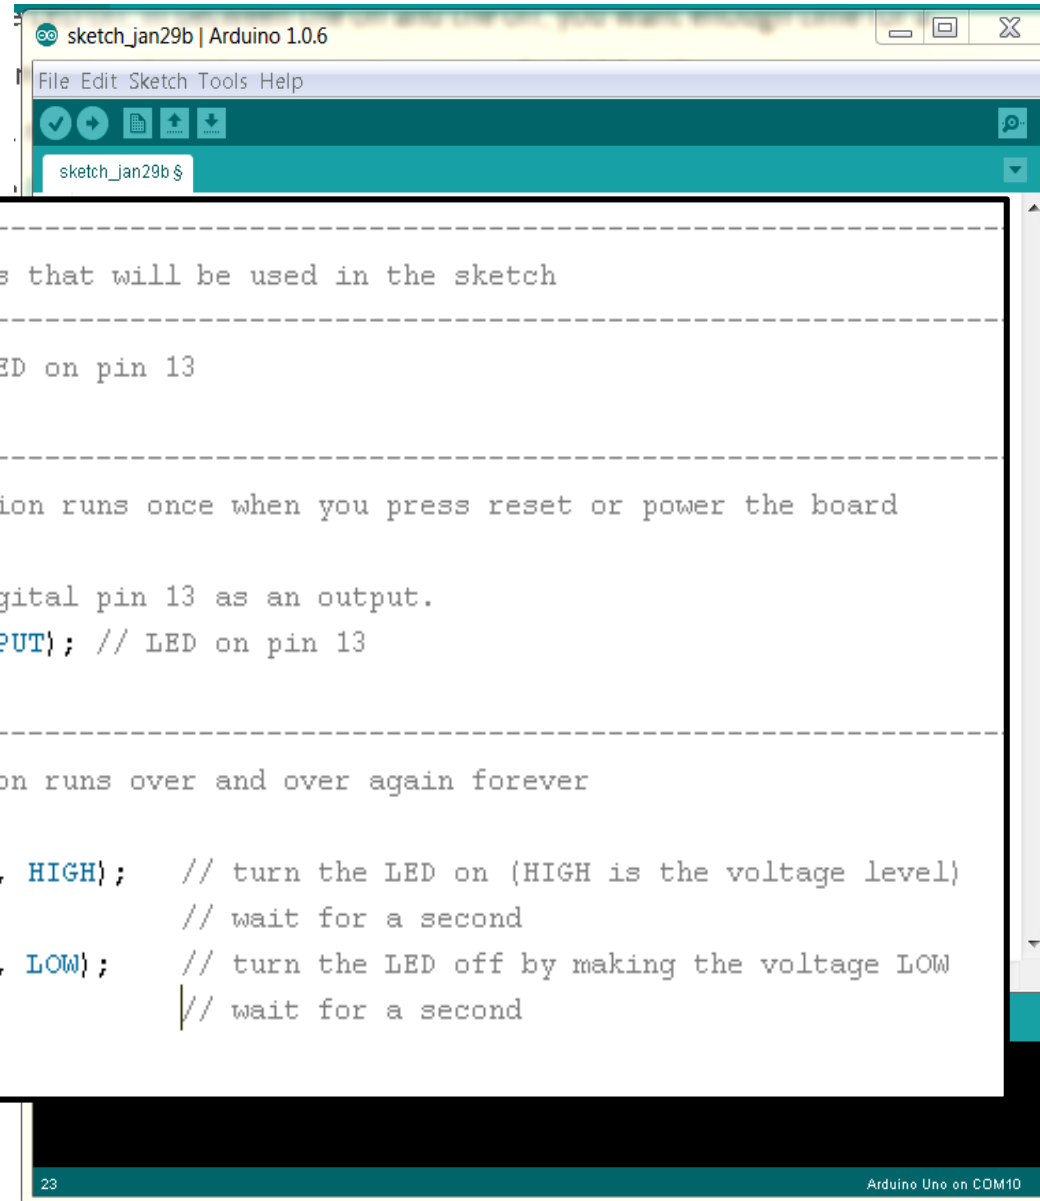

Turns LED ON

Delay 1 sec

Turns LED OFF

Delay 1 sec

```
12 // -----  
13 // define variables that will be used in the sketch  
14 // -----  
15 int led = 13; // LED on pin 13  
16  
17 // -----  
18 // the setup function runs once when you press reset or power the board  
19 void setup() {  
20     // initialize digital pin 13 as an output.  
21     pinMode(led, OUTPUT); // LED on pin 13  
22 }  
23 // -----  
24 // the loop function runs over and over again forever  
25 void loop() {  
26     digitalWrite(led, HIGH); // turn the LED on (HIGH is the voltage level)  
27     delay(1000); // wait for a second  
28     digitalWrite(led, LOW); // turn the LED off by making the voltage LOW  
29     delay(1000); // wait for a second  
30 }
```

# GO FROM A SKETCH TO BLINKING AN LED

## Host Computer

## Arduino

### Source Code

```
1 //  
2 // blink.  
3 // Turns on an LED on for one second, then off for one second, repeatedly.  
4  
5 // Most Arduinos have an on-board LED you can control. In the Uno and  
6 // Leonardo, it is attached to digital pin 13. If you're unsure what  
7 // pin the on-board LED is connected to on your Arduino board, check  
8 // the documentation at http://arduino.cc.  
9  
10 // This example code is in the public domain.  
11  
12 // created 3 May 2005  
13 // by David Cuatrecasas  
14 //  
15  
16 // the setup function runs once when you press reset or power the board  
17 void setup() {  
18   // initialize digital pin 13 as an output.  
19   pinMode(13, OUTPUT);  
20 }  
21  
22  
23 // the loop function runs over and over again forever  
24 void loop() {  
25   digitalWrite(13, HIGH); // sets the LED on (HIGH is the voltage level)  
26   delay(1000); // wait for a second  
27   digitalWrite(13, LOW); // sets the LED off by making the voltage low  
28   delay(1000); // wait for a second  
29 }  
30
```

# WHAT IN YOUR KIT

- Arduino Uno (clone)
- USB Cable
- Breadboard
- Battery Connector
- Jumper Wires
- 2 Buttons
- LEDs
- Resistors

# LET ME INTRODUCE YOU TO ARDUINO...

# POWERING YOUR ARDUINO UP FOR THE FIRST TIME

- Connect the USB cable from your PC to the Arduino

- Power “good” LED will turn on, you will see a bunch of Blinking on the RX/TX LED, and LED 13 should start Blinking

# WHERE ARE MY CODE EXAMPLES?

- Github - <https://github.com/jimTheSTEAMClown>

The image shows a composite of three screenshots from a GitHub profile. On the left is the profile for Jim Burnham (jimTheSTEAMClown), featuring a photo of him with a STEAM Clown doll. The middle screenshot shows the 'arduinoCode' repository page, with a red arrow pointing to the file list where 'steamClass\_BLINK' is highlighted in an orange box. The right screenshot shows the code view for 'steamClass\_BLINK', with a red arrow pointing to the code content. The code is as follows:

```
// =====  
  
void setup()  
{  
    pinMode(13, OUTPUT);  
}  
  
void loop()  
{  
    digitalWrite(13, HIGH);  
    delay(1000);  
    digitalWrite(13, LOW);  
    delay(1000);  
}
```

# BLINK - FIRST SKETCH

steamClass\_BLINK on github

Setup Function

In Setup, Define Pin  
Direction

Main Loop

Turns LED ON

Delay 1 sec

Turns LED OFF

Delay 1 sec

```
16 // =====
17
18 void setup()
19 {
20     pinMode(13, OUTPUT);
21 }
22
23 void loop()
24 {
25     digitalWrite(13, HIGH);
26     delay(1000);
27     digitalWrite(13, LOW);
28     delay(1000);
29 }
```

# BLINK - FIRST SKETCH

steamClass\_BLINK\_WithComments on github

Defines I/O Pin  
Connected to LED

```
29 // -----  
30 // the define variables that will be used in the sketch  
31 // -----  
32 // These constants, and the sketch won't change these values while running.  
33 // Typically these are pin labels and pin assignments:  
34 // These are ones I use as defaults in most of my sketches  
35 const int arduinoBoardLED = 13;    // LED on pin 13
```

Setup Function

```
36  
37 //  
38 // Sketch variables: These are variables for your sketch  
39 // These are ones I use as defaults in most of my sketches  
40  
41 // The setup routine runs once when you load the sketch or press reset:  
42 // This is where you define pin directions  
43 void setup()
```

In Setup, Define Pin  
Direction

```
44 {  
45  
46 // Serial.begin(9600);    // Use Serial Monitor to debug  
47 // initialize the digital pin as an output.  
48 pinMode(arduinoBoardLED, OUTPUT);  
49 }
```

Main Loop

```
50  
51 // the loop routine runs over and over again forever:  
52 void loop()
```

Turns LED ON

```
53 {  
54 //Set the LED pin to HIGH. This provides 5 volts to the LED and turns it on  
55 digitalWrite(arduinoBoardLED, HIGH);
```

Delay 1 sec

```
56 delay(1000); //Wait for a second
```

Turns LED OFF

```
57 //Set the LED pin to LOW. This turns it off
```

Delay 1 sec

```
58 digitalWrite(arduinoBoardLED, LOW);
```

```
59 delay(1000); //Wait for a second
```

```
60 }
```

```
61
```

**STEAM CLOWN™**  
& **Squeaky Hinge**  
**PRODUCTIONS**

# MAKE SURE YOU RENAME YOUR SKETCH

- When you name your Sketches, please Remove STEAM Clown or steamClass from your Sketch names...
- Please...

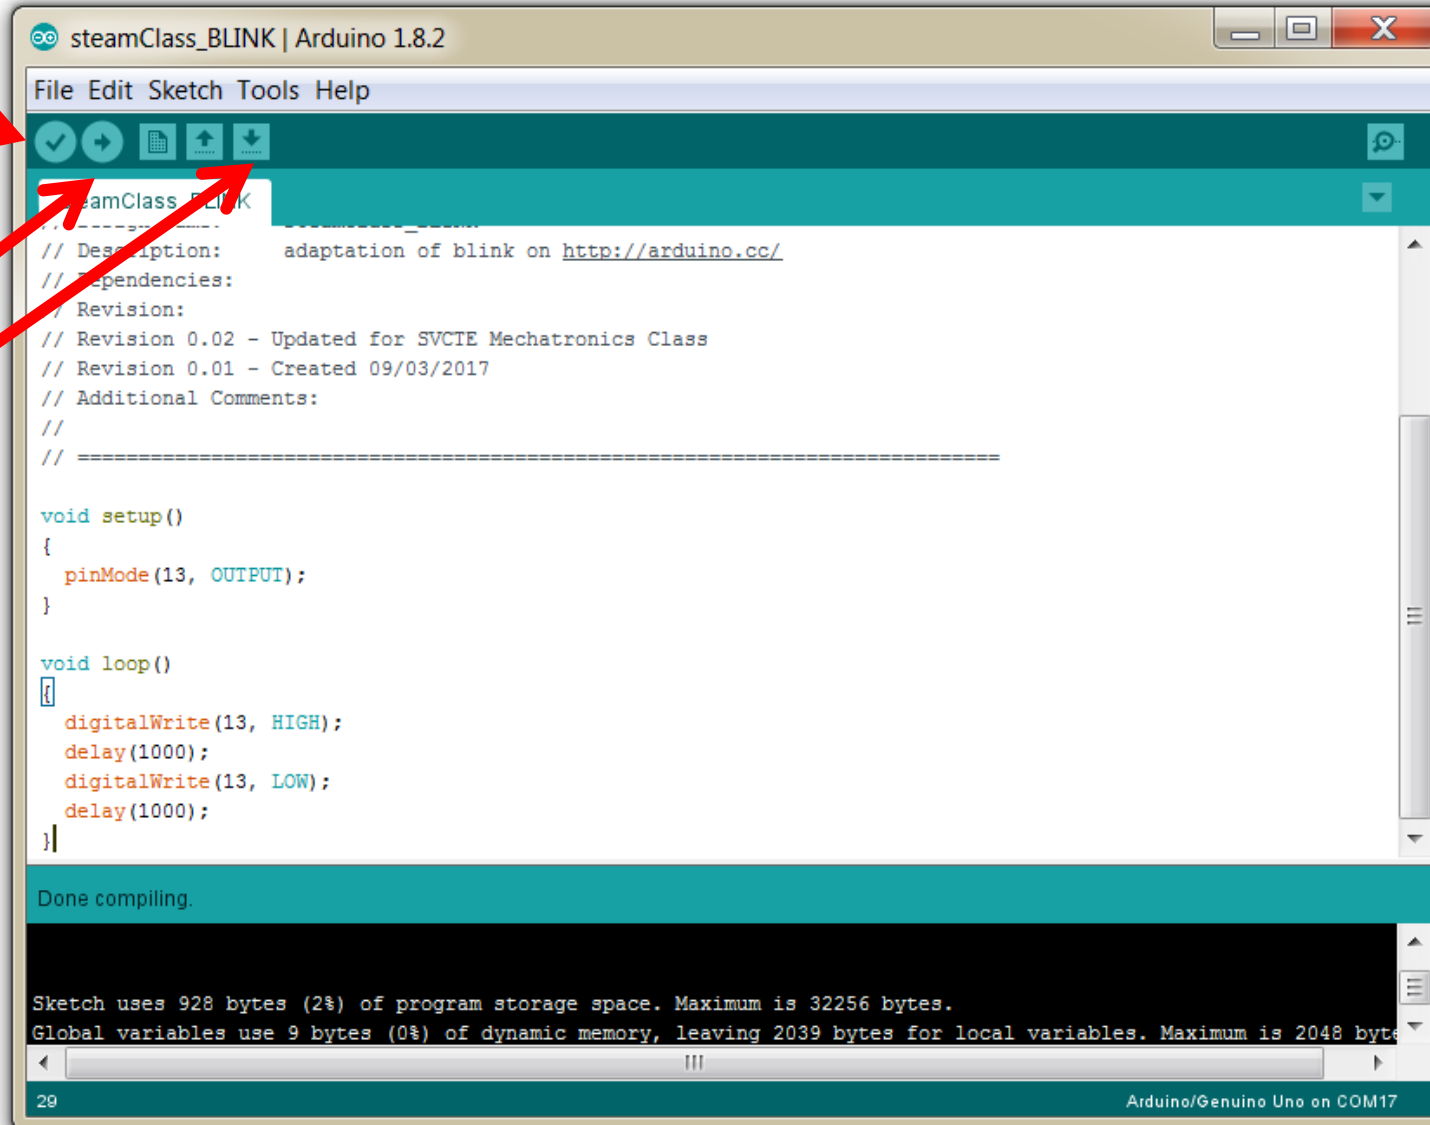

# BLINK FASTER: VERIFY, SAVE, RUN

1 Verify

3 Upload & Run

2 Save

# HOW DO YOU CHANGE THE BLINK RATE?

- Change the number in the delay(1000)
- Delay is measured in ms
- (1000 ms = 1 second)

```
// the loop function runs over and over again forever
void loop()
{
  digitalWrite(arduinoBoardLED, HIGH); // turn the LED on (pin 13) by setting the voltage HIGH
  delay(500); // wait for a second
  digitalWrite(arduinoBoardLED, LOW); // turn the LED off (pin 13) by setting the voltage LOW
  delay(500); // wait for a second
}
```

Change from 1000

to something like 500 or  
250 or 100

What can happen in 500 ms?
